**BERYLLIUM**

(Data in metric tons of beryllium content unless otherwise noted)

**Domestic Production and Use:** One company in Utah mined bertrandite ore, which it converted, along with imported beryl and beryl from the National Defense Stockpile, into beryllium hydroxide. Some of the beryllium hydroxide was shipped to the company's plant in Ohio, where it was converted into beryllium-copper master alloy, metal, and/or oxide—some of which was sold. Estimated beryllium consumption of 141 tons was valued at about $50 million, based on the estimated unit value for beryllium in imported beryllium-copper master alloy. Based on sales revenues, nearly one-half of beryllium use was estimated to be used in computer and telecommunications products, and the remainder was in aerospace and defense applications, appliances, automotive electronics, industrial components, and other applications.

**Recycling:** Beryllium was recycled mostly from new scrap generated during the manufacture of beryllium products. Detailed data on the quantities of beryllium recycled are not available, but may represent as much as 10% of apparent consumption.

**Import Sources (2004-07):**

1 Kazakhstan, 58%; United Kingdom, 10%; Ireland, 9%; Japan, 7%; and other, 16%.

**Tariff:**

- **Beryllium ores and concentrates:** 2617.90.0030 Free.
- **Beryllium oxide and hydroxide:** 2825.90.1000 3.7% ad val.
- **Beryllium-copper master alloy:** 7405.00.6030 Free.
- **Beryllium:**
  - Unwrought, including powders: 8112.12.0000 8.5% ad val.
  - Waste and scrap: 8112.13.0000 Free.
  - Other: 8112.19.0000 5.5% ad val.

**Depletion Allowance:** 22% (Domestic), 14% (Foreign).

**Government Stockpile:** The Defense Logistics Agency, U.S. Department of Defense, had a goal of retaining 45 tons of hot-pressed beryllium powder in the National Defense Stockpile. Disposal limits for beryllium materials in the fiscal year 2009 Annual Materials Plan are as follows: beryl ore, 36 tons of contained beryllium; beryllium-copper master alloy, 11 tons of contained beryllium; and beryllium metal, 36 tons.

**Stockpile Status—9-30-08:**

Prepared by Brian W. Jaskula [(703) 648-4908, bjaskula@usgs.gov, fax: (703) 648-7757]
BERYLLIUM

Events, Trends, and Issues: During the first three quarters of 2008, the leading U.S. beryllium producer had greater sales of bulk and strip beryllium-copper alloy products than during the first three quarters of 2007. Sales of beryllium products for defense applications and medical and industrial x-ray equipment were lower than those during the first three quarters of 2007; sales of beryllium to an experimental nuclear fusion reactor in Europe and to the National Aeronautics and Space Administration for the James Webb Space Telescope effectively ended in 2007. Sales of beryllium oxide ceramics were lower than those during the first three quarters of 2007.

In 2008, the leading U.S. beryllium producer opened a new bertrandite mine in Utah. The company also began construction of a new primary beryllium facility at its operations in Ohio. The engineering and design of the new facility was funded by the U.S. Department of Defense under the Defense Production Act, Title III. Construction and startup of the facility was expected to take 2 to 3 years; funding would require additional Title III approval. Primary beryllium facilities, the last of which closed in the United States in 2000, produce the feedstock used to make beryllium metal products.

Because of the toxic nature of beryllium, various international, national, and State guidelines and regulations have been established regarding beryllium in air, water, and other media. Industry must maintain careful control over the quantity of beryllium dust, fumes, and mists in the workplace. Control of potential health hazards adds to the final cost of beryllium products.

World Resources: World resources in known deposits of beryllium have been estimated to be more than 80,000 tons. About 65% of these resources is in nonpegmatite deposits in the United States—the Gold Hill and Spor Mountain areas in Utah and the Seward Peninsula area in Alaska account for most of the total.

Substitutes: Because the cost of beryllium is high compared with that of other materials, it is used in applications in which its properties are crucial. In some applications, certain metal matrix or organic composites, high-strength grades of aluminum, pyrolytic graphite, silicon carbide, steel, or titanium may be substituted for beryllium metal or beryllium composites. Copper alloys containing nickel and silicon, tin, titanium, or other alloying elements or phosphor bronze alloys (copper-tin-phosphorus) may be substituted for beryllium-copper alloys, but these substitutions can result in substantially reduced performance. Aluminum nitride or boron nitride may be substituted for beryllium oxide in some applications.

¹Estimated. E Net exporter. NA Not available. — Zero.  
¹¹Includes estimated beryllium content of imported ores and concentrates, oxide and hydroxide, unwrought metal (including powders), beryllium articles, waste and scrap, and beryllium-copper master alloy.  
¹²Change in total inventory level from prior yearend inventory.  
¹³The sum of U.S. mine shipments and net import reliance.  
¹⁴Calculated from gross weight and customs value of imports; beryllium content estimated to be 4%.  
¹⁵Defined as imports – exports + adjustments for Government and industry stock changes.  
¹⁶Significant releases of beryl from the National Defense Stockpile resulted in a positive net import reliance as a percentage of apparent consumption in 2006.  
¹⁷See Appendix B for definitions.  
¹⁸Actual quantity will be limited to remaining inventory.  
¹⁹See Appendix C for definitions.  
²⁰Less than ½ unit.
